

# 2mw wind power generation system design

## Overview

---

This paper describes the engineering design of the domestic first 2MW direct-drive PMSG system, including optimal machine design, converter topology choosing and its control. What are the aspects of permanent magnet machines for wind power industry?

In this thesis we discussed the various aspects of PM machines for wind power industry. Different types of generators are discussed and design aspects of permanent magnet machines also have been highlighted like mechanical structure, thermal behaviour and electromagnetic structure. In the end we will see the brief details.

Can a parallel-connected PWM converter enlarge the capacity of a wind generator?

By parallel-connected full power back-to-back PWM converters have been discussed. The optimal generator design and electromagnetic FE analysis are carried out for wind generation application. Two back-to-back converters with parallel connection are used to enlarge the capacity. Vector-

Does a downwind turbine need a yaw mechanism?

At some distance from the tower (as some manufacturers have found out to their cost). In a direct drive needs a yaw mechanism to keep the rotor facing the wind. Downwind Turbines Downwind machines have the rotor placed on the lee side of the tower. They have the theoretical advantage that they may be built without a yaw mechanism, if the rotor is

What is the maximum speed of a 2 MW generator?

The regions of the wind and the generator speeds. As an example, some design set the minimum speed of a 2 MW generator in a range of 900, 1000, 1125 and 1500 rpm in the design and construction of the production. The maximum speed of these generators is considered as 1500, 1800, 1875, 1900 and 2000 rpm for this specific application.
