

Asmara UPS uninterruptible power supply has outstanding cost performance

Overview

What is an uninterruptible power supply (UPS) system?

Power distortions such as power interruptions, voltage sags and swells, voltage spikes, and voltage harmonics can cause severe impacts on sensitive loads in the electric systems. Uninterruptible power supply (UPS) systems are used to provide uninterrupted, reliable, and high-quality power for these sensitive loads.

Why do we need uninterruptible power supplies?

However, during transmission and distribution, it is subject to voltage sags, spikes and outages that can disrupt computer operations, cause data loss and damage equipment. The uninterruptible power supplies protect the connected equipment from power problems and provide battery backup during power outages.

Why do you need an ups?

In situations where short-time power fluctuations or disturbed voltage occurs, an UPS provides constant power to keep the important loads running. During extended power failures, an UPS provides backup power to keep the systems running long enough so that they can be gracefully powered down. 18.1. Introduction.

What is ups output capacity?

The output capacity is the maximum power that the connected load can draw from the UPS system. It is expressed in VA (volt amperes). Currently, there are three types of the UPS systems: online, offline and line-interactive. Each of them has advantages and is more suitable for some applications than others.
