

# **BESS Haiti power generation and energy storage equipment**

## Overview

---

The objective of this Project is to maximize the use of the energy produced by Solar Power Plants (SPP) to further reduce the use of thermal power, by implementing a Battery Energy Storage System (BESS) at the Caracol Industrial Park of Haiti. This will be the first-of-a-kind investment in storage technology in Haiti at this size, and will signal to investors and government decision-makers the benefits of installing BESS to maximize the energy produced by SPP and further reduce the use of thermal power. What is a battery energy storage system (BESS)?

Overview. Battery energy storage systems (BESS) use rechargeable battery technology, normally lithium ion (Li-ion) to store energy. The energy is stored in chemical form and converted into electricity to meet electrical demand.

What does BESs do?

Key roles include: Primary power source support: in remote oil and gas operations where diesel or gas generators are the primary power source, BESS can store excess energy and provide backup power reducing generator run-time, improve fuel efficiency, and extend equipment life by reducing start/stop cycles.

What is a Bess meter & how does it work?

Renewable source intermittency: use BESS to increase behind the meter capacity of solar PV or wind. By installing systems with nameplate capacity larger than the load of an upstream operation, a BESS can store the excess energy for use when the sun is not shining or the wind is not blowing.
