EIEI POWER

Base station battery algorithm image

Overview

How does a battery group work in a base station?

The equipment in base stations is usually supported by the utility grid, where the battery group is installed as the backup power. In case that the utility grid interrupts, the battery discharges to support the communication switching equipment during the period of the power outage.

How does a virtual battery control a base station?

By regulating the charging and discharging behavior of the virtual battery of the base station in such a way that the base station avoids the peak period of power consumption and staggered power preparation, it is able to optimize the regional demand for electricity.

Why do communication base stations use battery energy storage?

Meanwhile, communication base stations often configure battery energy storage as a backup power source to maintain the normal operation of communication equipment [3, 4]. Given the rapid proliferation of 5G base stations in recent years, the significance of communication energy storage has grown exponentially [5, 6].

Can a virtual battery model be used for a base station?

Grounded in the spatiotemporal traits of chemical energy storage and thermal energy storage, a virtual battery model for base stations is established and the scheduling potential of battery clusters in multiple scenarios is explored.
