

Central Inverter and Micro Inverter

Overview

What is a micro-inverter vs a central inverter?

A micro-inverter is an inverter that pairs with a single solar panel to manage the DC-to-AC power inversion for that individual panel. The difference between a micro-inverter vs. a central inverter is that in micro-inverter systems, there is no centralized inverter. Instead, each panel is hooked up to its own micro-inverter.

What is a central inverter?

Central inverters, also called string inverters, connects solar (PV) panels in a string and convert the DC electricity into AC. A solar panel string is a group of wired panels in series connected to a single inverter. In general, an inverter can handle 7-12 panels in series on a particular string.

Are central inverters worth it?

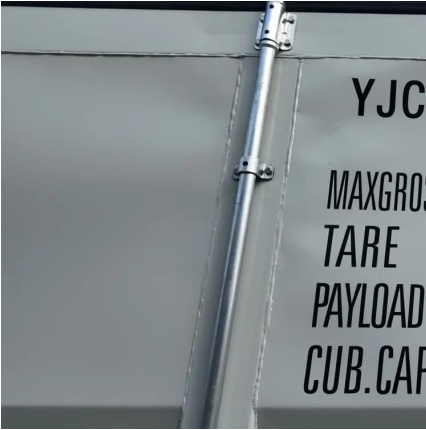

Despite their benefits, central inverters have limitations: **Shading Sensitivity:** If just one solar panel in a central inverter system is shaded, even partially, it can reduce the output of the entire array by as much as 50%. This makes central inverters less ideal for roofs with shading issues.

What is a micro inverter & how does it work?

Micro inverters have revolutionized the solar market by addressing many of the shortcomings of central inverters. These smaller devices are installed on each panel, converting DC to AC electricity right at the source. **Shade Resilience:** One of the biggest advantages of micro inverters is their ability to isolate panel performance.
