

Connecting solar panels with different currents in parallel

Overview

Should you connect solar panels in series or in parallel?

There are two main types of connecting solar panels – in series or in parallel. You connect solar panels in series when you want to get a higher voltage. If you, however, need to get higher current, you should connect your panels in parallel.

What happens if you connect solar panels in parallel?

When you connect solar panels in parallel, the total output voltage of the solar array is the same as the voltage of a single panel, while the total output current is a sum of the currents passing through each panel. The latter is only valid provided that the panels connected are of the same type and power rating.

How to wire solar panels together?

When it comes to wiring solar panels together, there are two main options: series and parallel. In this article, we will focus on wiring solar panels in parallel and provide a diagram to illustrate the setup. Wiring solar panels in parallel means connecting the positive terminals of each panel together and the negative terminals together.

How do you wire solar panels in parallel?

To wire solar panels in parallel, use the following steps: Connect all the positive terminals of all the solar panels together. Connect all the negative terminals of all the panels together. In a parallel connection, the voltages remain the same, while the current adds together.
