

# DC Inverter Fast Charging

## Overview

---

What is a DC fast charger?

DC fast chargers are high-powered electric vehicle charging stations which provide a much faster charging experience compared to the more conventional Level 1 or Level 2 battery chargers. These direct current level 3 fast chargers are typically found at public charging stations where drivers may need a quick boost to continue on their journey.

What is the voltage output of a DC fast charger?

The voltage output of this lower powered DC fast charger can vary depending on the charger's power rating and the vehicle it is charging but is typically around 200 to 400 volts which can add around 100-150 miles of range in 30-60 minutes of charge. Level 2 chargers commonly found at many public charging stations.

What is the difference between AC and DC fast chargers?

While most home charging systems use alternating current (AC) to charge a vehicle's battery, DC fast chargers use direct current. This key difference in how electricity is delivered allows DC fast chargers to bypass the car's onboard charging system and feed power directly into the battery, enabling significantly faster charging times.

How does DC fast charging work?

However, with DC fast charging, the charger itself handles the conversion from AC to DC power since batteries only accept DC power. This means that the direct current can be fed straight into the vehicle's battery, bypassing the slower onboard power converter.
