

Distributed solar power generation and energy storage

Overview

Currently, in the field of operation and planning of electrical power systems, a new challenge is growing which includes with the increase in the level of distributed generation from new energy sources.

What is distributed solar generation?

Distributed solar generation (DSG) has been growing over the previous years because of its numerous advantages of being sustainable, flexible, reliable, and increasingly affordable. DSG is a broad and multidisciplinary research field because it relates to various fields in engineering, social sciences, economics, public policy, and others.

What is energy storage in a distributed PV distribution network?

The energy storage system is connected to the distribution network, and the two storage systems assume the responsibility of supplying power to some nodes. The introduction of energy storage in the distributed PV distribution network reduces the dependence on thermal generators and improves the rate of elimination and economy.

Can photovoltaic energy be distributed?

This work presents a review of energy storage and redistribution associated with photovoltaic energy, proposing a distributed micro-generation complex connected to the electrical power grid using energy storage systems, with an emphasis placed on the use of NaS batteries.

Why do we need a distributed energy storage system?

After 1-year of operation and testing, AEP has concluded that, although the initial costs of this system are greater than conventional power solutions, the system benefits justify the decision to create a distributed energy storage systems with intelligent monitoring, communications, and control for planning of the future grid.
