## Overview

What is a grid-connected system?

A grid-connected system allows you to power your home or small business with renewable energy during those periods (daily as well as seasonally) when the sun is shining, the water is running, or the wind is blowing. Any excess electricity you produce is fed back into the grid.

How does a grid connected system work?

A grid-connected system — also called an on-grid system — has several parts that work together to send power to homes and businesses. The turbine takes the wind's kinetic energy and converts it to electricity. It also has some essential parts — a rotor, generator and gearbox — protected inside an enclosure called a nacelle.

How does a wind energy system work?

**Grid-Connected Systems:** Many residential wind energy systems are grid-connected, meaning they are connected to the local utility grid. Excess electricity generated by the wind turbine can be fed back into the grid, and homeowners may receive credit for the electricity they produce through net metering programs. 6.

Can solar and wind hybrid systems be integrated into main grids?

Nevertheless, there are obstacles to overcome before solar and wind hybrid systems may be successfully integrated into main grids. Technical factors are critical to guaranteeing the stability and dependability of the grid. These factors include energy storage, system design, and integration.
