

How big should I choose for a home charging inverter

Overview

In general, a 3000W to 5000W inverter works well for most homes, but the exact size depends on factors like household appliances, total power consumption, and battery setup. Do I need an inverter size chart?

The need for an inverter size chart first became apparent when researching our DIY solar generator build. Solar generators range in size from small generators for short camping trips to large off-grid power systems for a boat or house. Consequently, inverter sizes vary greatly.

What are the different solar inverter sizes?

Solar generators range in size from small generators for short camping trips to large off-grid power systems for a boat or house. Consequently, inverter sizes vary greatly. During our research, we discovered that most inverters range in size from 300 watts up to over 3000 watts. In this article, we guide you through the different inverter sizes.

What is a good inverter capacity for a house?

For houses, it is usually taken as 0.7. So, inverter capacity (VA) = Total power requirement (Watt) ÷ Power Factor Using the above example: Inverter capacity = $430 \div 0.7 = 614$ VA So, you must look for an inverter of around 650 VA or a little more. It is always better to keep some margin to avoid overload.

How much power does an inverter need?

For example, if your total running wattage is 2200W and your surge wattage adds another 400W, your total power requirement is 2600W. Inverters typically operate at an efficiency of around 85%-95%. To ensure your inverter can handle your total load, divide your total power consumption by the inverter's efficiency.
