

# How many panels are needed for a 15kw inverter in Freetown

## Overview

---

How big is a 15 kW solar system?

Most solar panels have a capacity of around 300 watts. Therefore, to achieve a 15kW solar system, you will need at least 50 solar panels or more. Each panel takes up approximately 17 square feet of space, resulting in a total footprint of 850 square feet for the entire system.

How many solar panels do you need for a 20kW Solar System?

For a 20kW solar system, you would need either 200 100-watt solar panels, 100 200-watt solar panels, 68 300-watt solar panels, or 50 400-watt solar panels. This is just how easy it is. We hope that this illustrates well how many solar panels you need for these differently-sized solar systems.

How many solar panels do I need for a 5kW system?

If you are using only 400-watt solar panels, you will need 13 400-watt solar panels for a 5kW solar system (13 × 400 watts is actually 5200 watts, so this is a 5.2kW system). Quite simple, right?

You can also mix solar panels with different wattages.

What is a recommended inverter power range?

By inputting your panel's rated power and number of panels, the calculator produces a recommended inverter power range that aligns with 80-100% of your system's total DC capacity. This approach ensures that your inverter is neither under-sized—risking energy losses and performance issues—nor over-sized, which can lead to unnecessary costs.
