

Internal measurement of new energy battery cabinet

Overview

How is a battery measured?

The battery is measured under 0.5C charging, 1C discharging and 1C charging and 3C discharging with large multiplication rate. It is also taken into account that the battery cannot be a simple process discharged at a constant multiplication rate in a real operating scenario.

How do flexible sensors measure battery temperature?

Flexible sensors measure internal temperatures of single cells in battery packs. High SOC and high multiplicity conditions significantly raise battery temperatures. Temperature fluctuations are pronounced in low-temperature environments. Heat generation and dissipation modeled via electrochemical thermodynamics.

How to find the location of a representative battery?

In order to further obtain the location of the representative battery, different ambient temperatures are set as variables to find the location of the representative battery in the typelliquid-cooled runner-PCM composite heat dissipation mode with better heat dissipation effect.

Why is it important to monitor the temperature of a battery pack?

For example, in a battery pack, the temperature of some cells may be higher than others, resulting in the formation of hot spots, which, if not properly managed, may lead to accelerated aging or even thermal runaway. Therefore, it is necessary to monitor the temperature of individual cells within a battery pack.
