

# **Inverter grid-connected grid voltage overvoltage**

## Overview

---

Multiple single-phase inverters are connected to the same live wire, causing voltage imbalance in the grid, resulting in grid voltage increase and inverter overvoltage display. Why do on grid inverters show overvoltage?

When the voltage range of on grid inverter exceeds the prescribed on grid voltage range, the inverters will show the overvoltage of the grid. In addition, the long, thin, winding or irregular material of the cable used to connect the inverters to the grid will lead to the increase of voltage difference at the AC end of the on grid inverters.

What are grid-connected inverters?

Grid-connected inverters (GCI) are used to feed power from renewable energy distributed generators into the grid\*. They are widely used for this purpose. Repetitive control (RC) enables such inverters to inject high quality fundamental-frequency sinusoidal currents into the grid.

What is a grid connected PV system?

A block diagram representing a grid connected PV system is shown in fig.1. It consists of a PV generator which is connected to the dc side of a three phase voltage source inverter (VSI). The MPPT regulates dc link voltage. The inverter used here is a four legged inverter.

How is an inverter disconnected from the grid?

Inverter is disconnected from the grid after a particular time by using timed breaker logic in order to prevent the sending of power during fault. IV. The whole system is simulated in PSCAD/EMTDC software environment.

## Inverter grid-connected grid voltage overvoltage
