## Overview

---

Are flow batteries safer than lithium ion batteries?

Flow batteries are generally considered safer than lithium-ion batteries. The risk of thermal runaway is low, and they are less prone to catching fire or exploding. Lithium-ion Batteries Lithium-ion batteries ' safety is a significant concern due to their susceptibility to thermal runaway, which can lead to fires or explosions.

What is the difference between flow batteries and lithium ion batteries?

Compared to lithium-ion batteries, flow batteries offer superior scalability due to their ability to easily increase energy capacity by adding more electrolytes to the tanks. Lithium-ion batteries, on the other hand, have limited scalability, as their capacity is primarily determined by the number of cells in the battery pack.

Why do flow batteries have a low energy density?

Flow batteries, while offering advantages in terms of decoupled power and energy capacity, suffer from lower energy density due to limitations in the solubility of active materials and electrode capacity. The broad voltage windows of non-aqueous electrolytes in flow batteries can also impact their energy density.

What are the advantages and compromises of lithium ion?

advantages and compromises that are essential for energy storage technologies. Lithium-ion ability to charge and discharge rapidly. This makes them very desirable for applications that need compactness and high power output. effect due to decreased CO<sub>2</sub> emissions and toxicity ratings, and their capacity to be scaled up.
