

Peak-shifting energy storage solution

Overview

What is peak shaving & load shifting?

Peak shaving and load shifting are two essential energy management strategies that help businesses and households reduce electricity costs, improve energy efficiency, and support grid stability. These strategies are especially powerful when combined with battery energy storage systems (BESS). What is Peak Shaving?

.

What is peak shaving & how does it work?

Peak shaving, also known as load shedding, refers to the practice of reducing electricity usage during periods of high demand to avoid expensive demand charges and peak-hour electricity rates. It's an effective way to manage energy costs, especially for industrial and commercial users. How Does It Work?

.

What is load shifting?

Load shifting is the process of moving electricity consumption from peak periods to off-peak periods, typically when electricity is cheaper and grid demand is lower. A Battery Energy Storage System (BESS) enables this by charging during off-peak times and discharging during peak times. Example:.

Why is load shifting important?

Load shifting helps distribute energy use more evenly throughout the day, reducing grid congestion and allowing for better integration of renewable energy sources like solar and wind. 5. Energy Independence & Resilience
