

# **Photovoltaic Energy Storage Container Two-Way Charging Transactions**

## Overview

---

What is a photovoltaic-energy storage-integrated charging station (PV-es-I CS)?

As shown in Fig. 1, a photovoltaic-energy storage-integrated charging station (PV-ES-I CS) is a novel component of renewable energy charging infrastructure that combines distributed PV, battery energy storage systems, and EV charging systems.

Can photovoltaic-energy storage-integrated charging stations improve green and low-carbon energy supply?

The results provide a reference for policymakers and charging facility operators. In this study, an evaluation framework for retrofitting traditional electric vehicle charging stations (EVCSs) into photovoltaic-energy storage-integrated charging stations (PV-ES-I CSs) to improve green and low-carbon energy supply systems is proposed.

Can a PV & energy storage transit system reduce charging costs?

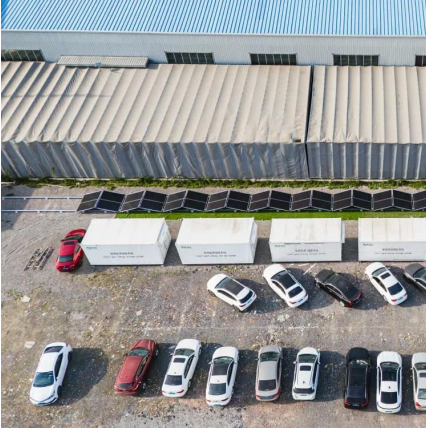

Furthermore, Liu et al. (2023) employed a proxy-based optimization method and determined that compared to traditional charging stations, a novel PV + energy storage transit system can reduce the annual charging cost and carbon emissions for a single bus route by an average of 17.6 % and 8.8 %, respectively.

How does a PV system work?

PV systems connect to the high-voltage DC bus through a bidirectional converter, this allows the load power supply to be controlled to meet the required power demand [43, 44]. The converter consists of the electrical energy storage voltage (EESV), an inductor L, a capacitor C, and switches (S1, S2) for the battery, and S3, S4 for the SC.
