

Protection of grid-connected inverter

Overview

What happens when the grid-tie inverter stops supplying power to the grid?

Automatic recovery of the grid-connected protection: After the grid-tied inverter stops supplying power to the grid because of the fault of the grid, the grid-tie inverter should be able to automatically send power to the grid 5 min after the grid voltage and frequency return to the normal range for 20s.

What is grid tie inverter overvoltage protection?

1. Input overvoltage protection: When the DC-side input voltage is higher than the maximum allowable DC array access voltage of the grid tie inverter, the inverter is not allowed to start or stop within 0.1s (in operation) and a warning signal is released at the same time.

How can a grid be protected from overcurrent faults?

Another option is to eliminate overcurrent protection schemes and develop more advanced protection schemes that use current differential or other methods to detect and clear faults. An additional protection scheme used on the grid is based on special relays that measure the rate of change of frequency (ROCOF).

Are grid-forming inverters a viable alternative to traditional protection schemes?

Grid-forming (GFM) inverters are anticipated to play an essential role in facilitating the integration of renewable energy in bulk power systems. The fault response of GFM inverters and its impact on traditional protection schemes are ongoing research topics.
