## Overview

What are lithium nickel manganese cobalt oxides?

Lithium Nickel Manganese Cobalt Oxides are a family of mixed metal oxides of lithium, nickel, manganese and cobalt. Nickel is known for its high specific energy, but poor stability. Manganese has low specific energy but offers the ability to form spinel structures that allow low internal resistance.

Can Ni-rich nickel-cobalt-manganese oxides be used as cathode materials for Li?

This review provides an overview of recent advances in the utilization of Ni-rich nickel-cobalt-manganese (NCM) oxides as cathode materials for Li-ion rechargeable batteries (LIBs). In the past decade, Ni-rich NCM cathodes have been extensively investigated because of their rational capacity and easy accessibility of constituent elements.

What is ternary oxide lithium nickel manganese cobalt oxide?

Layered ternary oxide lithium nickel manganese cobalt oxide,  $\text{LiNi}_{0.5}\text{Co}_{0.2}\text{Mn}_{0.3}\text{O}_2$  (NCM523, or NMC532), has displayed great advantages in its relatively high energy density, low cost, low toxicity, cycle stability and safety as battery materials for electric vehicles.

Are nickel manganese cobalt oxide (NMC) cathodes dangerous?

These risks are heightened in the context of nickel manganese cobalt oxide (NMC) cathodes, which exhibit much higher social risks compared to lithium manganese oxide (LMO) cathodes.
