

Serbia bifacial solar panels

Overview

Do bifacial solar panels produce more energy?

Bifacial solar modules use both sides of the panel to produce energy. Manufacturers say that bifacial solar panels can generate up to 30% more energy than monofacial panels. Great news for those with limited roof space. Most bifacial panels are frameless and covered by tempered glass on both sides.

Can bifacial solar power increase power generation?

While traditional solar panels only harvest light from one side, bifacial technology transforms previously wasted reflected light into valuable energy, potentially increasing power generation by up to 30%.

What are bifacial solar panels?

Bifacial solar panels are different. These types of panels have solar cells on both sides, enabling them to absorb light from the front and the back. By capturing light reflected off the ground through the backside of the panel, each panel is able to produce more electricity.

Are bifacial solar panels better than monofacial panels?

The technology behind solar panels continues to evolve and improve. Manufacturers are now able to produce bifacial panels, which feature energy-producing solar cells on both sides of the panel. With two faces capable of absorbing sunlight, bifacial solar panels can be more efficient than traditional monofacial panels – if used appropriately.
