

Solar thin film module structure

Overview

What is a thin-film solar cell?

Thin-film solar cell, type of device that is designed to convert light energy into electrical energy (through the photovoltaic effect) and is composed of micron-thick photon-absorbing material layers deposited over a flexible substrate. Learn more about thin-film solar cells in this article.

What are thin film solar panels?

Thin film solar cells utilized ultra-thin layers of photovoltaic materials deposited onto substrates, significantly reducing material usage and production costs. This breakthrough opened up new possibilities for lightweight, flexible, and low-cost solar panels.

How does a thin film work in a solar cell?

For instance, in solar cells, thin films made of semiconductor materials like cadmium telluride (CdTe) or copper indium gallium selenide (CIGS) are utilized to absorb sunlight and generate electricity. The efficiency of these devices depends on the thin film's ability to effectively absorb light and convert it into charge carriers ().

What is a thin film in a photovoltaic cell?

Thin films in photovoltaic cells are engineered to enhance light absorption and reduce energy losses. Anti-reflective coatings, typically composed of silicon nitride (Si_3N_4) or titanium dioxide (TiO_2), are applied as thin films on solar cell surfaces to minimize reflection and maximize sunlight absorption into the active layer.
