

Thin-film solar module classification

Overview

What is a thin-film solar panel?

Thin-film modules use one of the following four technologies: cadmium telluride (CdTe), amorphous silicon (a-Si), copper indium gallium selenide (CIGS), and organic photovoltaic cells (OPV). They use less material than traditional panels, including toxic materials & their construction makes them highly bendable and less susceptible to cracks.

What are thin film solar cells?

Thin film solar cells are favorable because of their minimum material usage and rising efficiencies. The three major thin film solar cell technologies include amorphous silicon (α -Si), copper indium gallium selenide (CIGS), and cadmium telluride (CdTe).

What are thin-film solar cells (tfscs)?

Thin-film solar cells (TFSCs), also known as second-generation technologies, are created by applying one or more layers of PV components in a very thin film to a glass, plastic, or metal substrate.

What materials are used for thin-film solar technology?

The most commonly used ones for thin-film solar technology are cadmium telluride (CdTe), copper indium gallium selenide (CIGS), amorphous silicon (a-Si), and gallium arsenide (GaAs). The efficiency, weight, and other aspects may vary between materials, but the generation process is the same.
