

What are micro inverters

Overview

What is a solar micro inverter?

Micro inverters are different from string inverters which connect several panels in series; a solar micro inverter can be installed on 4 panels to operate independently thus producing maximum energy. • DC to AC Conversion: Takes direct current power from every panel and converts it to an alternate current power.

What is a microinverter & how does it work?

A microinverter is a small, individual inverter that is typically installed directly on the back of each solar panel in a PV system. Unlike traditional string or central inverters, which convert the DC power from multiple solar panels (a “string”) into AC power at a single point, microinverters perform this conversion at the individual panel level.

What is the difference between a string inverter and a microinverter?

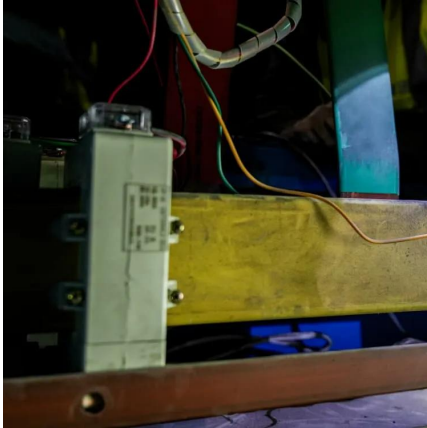

While in the case of string inverters, all solar panels ultimately connect to a single string inverter (most of the time), microinverters connect to each other, eventually transferring converted energy to the inside of the property for domestic use.

Why should you install a micro inverter?

Ideal for shaded areas: If your rooftop is shaded, reducing the power generation of the solar panels, installing a micro inverter can help generate more power. Better monitoring: In micro inverters all the solar panels are monitored separately. If there is a problem in any one panel, we can easily identify and replace it.
