

# **Why does the new energy battery cabinet release gas**

## Overview

---

How does battery room ventilation work?

**Battery Room Ventilation Requirements** While charging, batteries used in data centers emit hydrogen gas. This gas, which is lighter than oxygen, rises to the highest point within the room.

What is a battery backup and energy storage room?

Battery Backup and Energy storage rooms are specialised spaces designed for housing battery systems that store excess energy generated during off-peak times for use during peak times. What is the Government Legislation?

Providing appropriate gas detection measures in your battery backup room isn't just best practice; it's a legal requirement.

Do lead-acid batteries release hydrogen gas?

It is common knowledge that lead-acid batteries release hydrogen gas that can be potentially explosive. The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small.

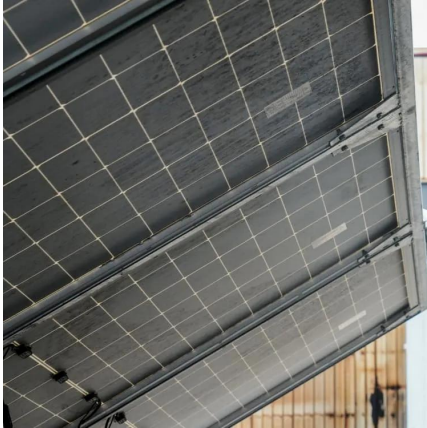

Why do batteries need to be ventilated?

The battery rooms must be adequately ventilated to prohibit the build-up of hydrogen gas. During normal operations, off gassing of the batteries is relatively small. However, the concern is elevated during times of heavy recharge or the batteries, which occur immediately following a rapid and deep discharge of the battery.
